Note: Quantities in Tonnes. Each Actual cell draws two rings (outer = Saleable Steel, inner = Special Steel), both its own 100% Finished/Semis split starting Finished at the same top edge. Saleable Steel is Production data, Special Steel is Despatch data — different physical flows for the same plant, so the inner ring isn't a slice of the outer ring's total. Spl. FS's 2nd % line is its share of Finished Steel alone (value-added intensity), not of Saleable Steel. The Annual ABP Plan column has no Finished/Semis split for its Special Steel target, so it shows one plain ring and a single aggregate Spl figure (no Finished-Steel-share line).
